DISCUSSION by Robert K. Hampton

The authors have made another worthy contribution to the industry's gradually increasing knowledge concerning incinerator waste water, or a better term used by them, process water.

Although the authors were searching for other answers, it would have been most helpful to have also included schematic flow diagrams of each plant.

Taking a series of tests over an extended period, as the authors did, is the only way a complete meaningful conclusion can be made.

Hopefully, the Consulting Engineers, with help from regulating agencies, can convince municipalities and plant owners of industrial incinerators to spend the money required to install additional instrumentation required to secure this type of seemingly research oriented information. Along with this would be the training and development of the interest of the plant operator to secure his eager cooperation.

This would allow for a better operation of the existing facilities as well as providing information needed in future designs.
